Blood Bank System   **February 2022 — June 2022**

Designed with (PHP, MySQL, Html, CSS, JavaScript, Bootstrap).

This system is a browser-based system designed to store, process, retrieve and analyze information related to administrative management and inventory management within the blood bank. therefore, this project aims to develop a system that preserves all information Related to blood donors and different blood units and help bank employees manage it in a better way.

In short, the system requires from the donors to create an account on the website (blood bank) and book an appointment for donation. Then, the blood bank employee enters the blood unit into database. On the other side the recipients (hospitals) who have submitted a request to create an account with the blood bank, the request is will be either accepted or rejected by the employee, and in the case of acceptance, the recipients (hospitals) can request blood from the bank.
